GSTR-2B to TallyPrime Import Tool

By Monil Shah

A tool to import B2B purchase invoices from GSTR-2B (JSON or Excel/CSV) directly into TallyPrime as Purchase vouchers — automatically, without manual data entry.

Requirements

- Windows PC with TallyPrime installed and open
- Python 3.9 or higher → https://www.python.org/downloads/
- Internet connection (only needed for first-time setup)

One-Time Setup

Step 1 — Install Python Libraries

Open **Command Prompt** and run this single line:

pip install fastapi uvicorn requests python-multipart openpyxl pandas

Wait for it to finish. You only need to do this once.

Step 2 — Configure TallyPrime

This must be done **before** running the tool. Open TallyPrime and follow these steps:

1. Press **F1** → go to **Settings**
2. Click **Connectivity**
3. Under **Client/Server Configuration**, set:
    - **TallyPrime acts as:** Server
    - **Enable ODBC:** Yes
    - **Port Number:** 9000
4. Press **Enter** to save and restart TallyPrime if prompted

⚠️ If this is not configured correctly, the tool will show a "Cannot connect to TallyPrime" error.

Step 3 — Open the Correct Company in TallyPrime

Make sure the company you want to import into is **open and active** in TallyPrime before running the tool.

Running the Tool

Step 1 — Start the Server

Double-click gstr2b_to_tally.py to run it, or open Command Prompt in the same folder and run:

```
python gstr2b_to_tally.py
```

You will see:

```

============================================================
  Open: http://localhost:8000/docs
```

Step 2 — Open the Tool in Your Browser

Open your browser and go to:

http://localhost:8000/docs

Leave the Command Prompt window open while you are using the tool.

How to Import — Step by Step

Using GSTR-2B JSON File

Step	Endpoint	What it does
1	POST /check-ledgers	Upload JSON → checks which party ledgers are missing in Tally. **No entries created. Safe to run anytime.**
2	POST /upload-gstr2b	Upload JSON → imports all B2B invoices as Purchase vouchers

Using Excel or CSV File

Step	Endpoint	What it does
1	POST /check-ledgers-excel	Upload Excel/CSV → checks which party ledgers are missing in Tally. **No entries created. Safe to run anytime.**
2	POST /upload-excel	Upload Excel/CSV → imports all invoices as Purchase vouchers

✅ **Always run Step 1 first.** If ledgers are missing, create them in TallyPrime before running Step 2.

Excel / CSV File Format

Your Excel or CSV file must have these columns (exact spelling is flexible):

Column	Accepted Names
Party Name	Party Name, Supplier, Vendor, Trade Name
Invoice Number	Invoice Number, Invoice No, Bill No, Bill Number
Invoice Date	Invoice Date, Inv Date, Bill Date, Date
Taxable Value	Taxable Value, Taxable Amount, Basic Value, Base Amount
CGST *(optional)*	CGST, CGST Amount, Central GST
SGST *(optional)*	SGST, SGST Amount, State GST
IGST *(optional)*	IGST, IGST Amount, Integrated GST

Date format: Use DD-MM-YYYY or DD/MM/YYYY (e.g. 15-04-2025)

ℹ️ If CGST/SGST/IGST columns are missing, tax amounts default to zero.

Missing Ledgers

When you run **Check Ledgers** (Step 1), if any party names are not found in TallyPrime, a file called missing_ledgers.txt will be saved in the same folder as the script.

Open that file — it lists every ledger you need to create in TallyPrime before importing.

How to create missing ledgers in TallyPrime:

1. Go to **Gateway of Tally → Accounts Info → Ledgers → Create**
2. Enter the party name **exactly** as shown in missing_ledgers.txt
3. Set the group to **Sundry Creditors**
4. Save

Repeat for each missing ledger, then run Step 2 to import.

Understanding Results

Response	Meaning
✅ success	All invoices imported successfully
⚠️ partial	Some imported, some failed — see failed_invoices in the response
❌ missing ledger	One or more party ledgers don't exist in Tally — create them and retry
❌ Unknown Request	TallyPrime XML gateway is not enabled — redo the Tally configuration in Step 2 above
❌ CREATED=0	Press **F2** in TallyPrime to set the correct financial year period
❌ Cannot connect	TallyPrime is not open, or port 9000 is not configured

Debug Tools

If something goes wrong, these links help diagnose the issue:

Link	What it shows
http://localhost:8000/debug-tally	Last raw XML response from TallyPrime
http://localhost:8000/debug-dates	Invoice dates that could not be parsed
http://localhost:8000/debug-xml?voucher_num=1	XML fields of a specific voucher (replace 1 with actual voucher number)

Stopping the Tool

Go back to the Command Prompt window and press **Ctrl + C** to stop the server.

Important Notes

- The tool only imports **B2B invoices** (registered supplier invoices)
- Party names in your file must **exactly match** the ledger names in TallyPrime (including spacing and capitalisation)
- The tool does **not** modify or delete any existing vouchers
- Run **Check Ledgers first** every time you have a new file — it is completely safe and creates no entries
