GSTR-2B to TallyPrime Import Tool

User Instructions & Setup Guide

By Monil Shah

1. Overview

This tool allows you to import B2B purchase invoices from your **GSTR-2B JSON file** (downloaded from the GST Portal) or an **Excel / CSV file** directly into **TallyPrime** — eliminating manual data entry of purchase vouchers.

i	This tool runs entirely on your local machine. No data is sent to any external server.

2. Prerequisites

Ensure the following are available before proceeding:

Python	Version 3.8 or higher — download from python.org. During installation, check "Add Python to PATH".
TallyPrime	Installed and running on the same machine. Gateway Server must be enabled on port 9000 (see Section 3).
GST Portal Access	GSTR-2B JSON file downloaded from gst.gov.in, OR an Excel/CSV with invoice data.
Internet	Required only for the initial pip install of dependencies.

3. Configure TallyPrime

This must be done **before** running the tool. Open TallyPrime and follow these steps:

1	**Press F1 → go to Settings** From the Gateway of Tally, press **F1** on your keyboard.
2	**Click Connectivity** In the Settings panel, select **Connectivity**.
3	**Under Client/Server Configuration, set the following:** ◦ **TallyPrime acts as:** Server ◦ **Enable ODBC:** Yes

	◦ **Port Number:** 9000
4	**Press Enter to save and restart TallyPrime if prompted** TallyPrime will now accept XML requests from the import tool on port 9000.

> ⚠ *TallyPrime must remain open with a company loaded throughout the entire import process. Do not close it.*

4. Launch the Tool

Option A — Windows (Recommended)

Double-click **START_TOOL.bat**. This will automatically:

- Check that Python is installed
- Install all required libraries if not already present
- Start the local server
- Open the tool UI in your browser at **http://localhost:8000/ui**

> ⚠ *Keep the terminal/command window open while using the tool. Closing it will stop the server.*

Option B — Manual (Windows / Mac / Linux)

Open a terminal in the tool folder and run:

```
pip install fastapi uvicorn requests python-multipart openpyxl pandas
python gstr2b_to_tally.py
```

Then open your browser and go to: **http://localhost:8000/ui**

5. Ledger Configuration in TallyPrime

The tool maps GST tax components to the following ledgers in TallyPrime by default:

GST Component	Default TallyPrime Ledger	Ledger Group
Purchase	Purchase	Purchase Ledger
Input CGST	Input CGST	Duties & Taxes
Input SGST	Input SGST	Duties & Taxes
Input IGST	Input IGST	Duties & Taxes

> **i** If your TallyPrime company uses different ledger names, update the constants at the top of gstr2b_to_tally.py before running.

6. Import Workflow

Follow this sequence every time you import a new GSTR-2B period:

Phase	Action	Tool Endpoint
Step 1	Check for missing supplier ledgers (dry run — no entries created)	`/check-ledgers`
Step 2	Create any missing ledgers manually in TallyPrime	`TallyPrime`
Step 3	Import all invoices from GSTR-2B JSON or Excel/CSV	`/upload-gstr2b or /upload-excel`
Step 4	Review debug files for any errors or skipped entries	`Local folder`

Step 1 — Check for Missing Ledgers

In the tool UI, use **Check Ledgers** (for JSON) or **Check Ledgers from Excel**. This is a **dry run** — it does not create any entries in Tally. It generates **missing_ledgers.txt** in the tool folder listing all supplier party ledgers not found in your Tally company.

> ⚠ *Do not skip this step. Importing without creating missing ledgers will cause those invoices to fail silently.*

Step 2 — Create Missing Ledgers in TallyPrime

Open **missing_ledgers.txt** and create each listed supplier as a ledger in TallyPrime under the group **Sundry Creditors**.

Step 3 — Run the Import

Use **Upload GSTR-2B JSON** or **Upload Excel / CSV** from the UI. The tool will post all B2B purchase invoices as **Purchase Vouchers** in TallyPrime.

Step 4 — Verify in TallyPrime

After import, open TallyPrime and verify entries under **Day Book** or **Purchase Register**. Cross-check totals against your GSTR-2B statement.

7. Debug & Log Files

The following files are created in the same folder as **gstr2b_to_tally.py**:

File	Purpose
`missing_ledgers.txt`	Lists supplier names not found in TallyPrime

`tally_debug.txt`	Raw XML response from the last Tally request — useful for diagnosing failures
`date_errors.txt`	Invoices skipped due to an unrecognised date format

8. Troubleshooting

Issue	Resolution
Browser shows "Connection Refused"	Ensure START_TOOL.bat terminal is still open and Python server is running
Invoices not appearing in Tally	Check missing_ledgers.txt — create missing ledgers in Tally and re-run
"Python not found" error	Reinstall Python and ensure "Add to PATH" is checked during setup
Date parse errors	Open date_errors.txt — manually post those invoices in TallyPrime
Tally not responding	Verify port 9000 is set in TallyPrime Connectivity settings and a company is open

9. Support & API Reference

Full interactive API documentation is available while the tool is running at: **http://localhost:8000/docs**

For issues, refer to the debug files listed in Section 7 before raising a support request.
